323-34 Project 5: QuadTrees

 $\mathbb{C}++$

Student: Seratul Ambia

Project Due Date: 3/30/2021

Algorithm Steps:

 Create an image class with objects of numRows, numCols, minVal, maxVal, and power2size.

2. Read the first line of the input to find the numRows, numCols, minVal, and maxVal.

3. We want to find the power2Size so we need to use the method computePower2 which finds the smallest power of two that fits the image.

- 4. We want to take all the numbers inside the image and place into a2d array with prerequisites of power2size.
- 5. We want to start to build the quad tree and divide them into children. Based off the powers of two, we will see which boxes have 0s, and 1s. If there is a mix of 0s and 1s, it will be a 5 and broken down into more children.
- 6. There will be 4 children of NW, NE, SW, SE which will continuously be broken into more children based on the powers of 2.
- 7. Afterwards, we want to be able to post the tree in preorder and postorder reading from left to right and indicating the children of each leaf.
